

Epreuve écrite en Chimie 2015 : Corrigé modèle

I. Acides aminés et amines (14p)

1) a)

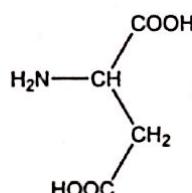

b) i. $4 \text{M(O)} / \text{M(Asp)} = 48,1/100$
 $\text{M(Asp)} = 133 \text{ g/mol}$

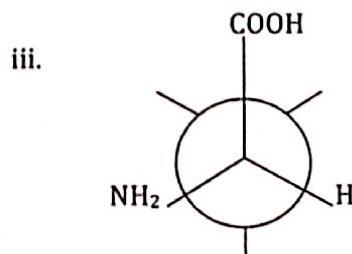

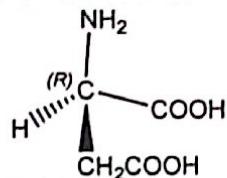

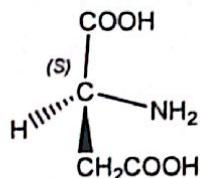

$$12n + 2n - 1 + 90 + 16 = 133$$

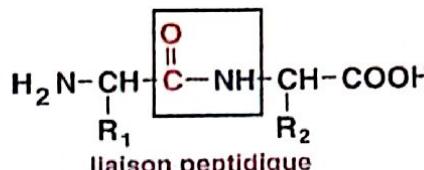

$$n = 2$$

ii.

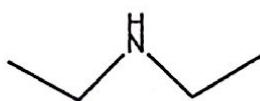

c)

$$\text{R}_1 = -\text{CH}_2\text{-COOH}$$

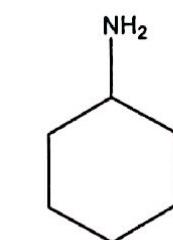

$$\text{R}_2 = -\text{CH}_2\text{-SH}$$

2)

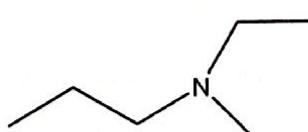

amine secondaire

2x effet I+

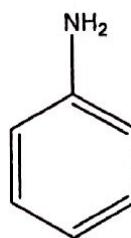

> amine primaire

effet I+

> amine tertiaire

3x effet I+ mais
 angle d'accès réduit
 par l'encombrement
 stérique

> amine aromatique

doublet de NH_2
 participe à la
 mésomérie du cycle

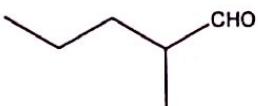

II. Composés organiques oxygénés (13p)

1) a) l'alcool A est oxydé en cétone
 composé C : 3-méthylbutanone

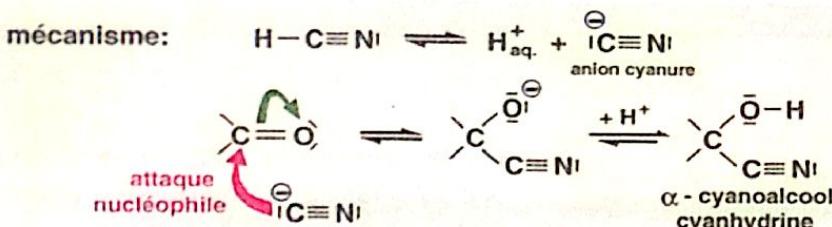

Système rédox :

b) i. 2-méthylpentanal

ii.

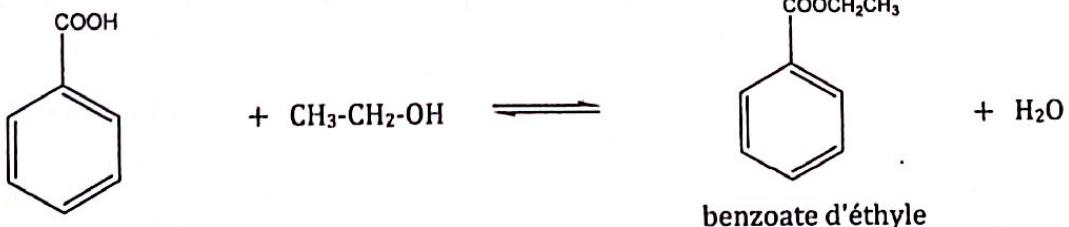

L'addition d'HCN sert à allonger la chaîne carbonée d'un atome.

2) voir livre p.62

III. Estérification et saponification (17p)

1) voir livre p. 56-57

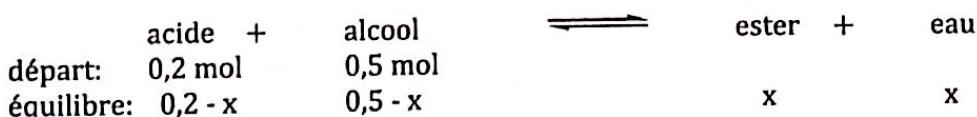

2) a)

b) Départ:

$$n(\text{acide}) = \frac{m}{M} = \frac{24,4\text{g}}{122\text{ g/mol}} = 0,2 \text{ mol}$$

$$n(\text{alcool}) = 0,5 \text{ mol}$$

$$K = \frac{x^2}{(0,2-x)(0,5-x)} = 4$$

$$x_1 = 3,2 \text{ mol} \quad \text{à écartier}$$

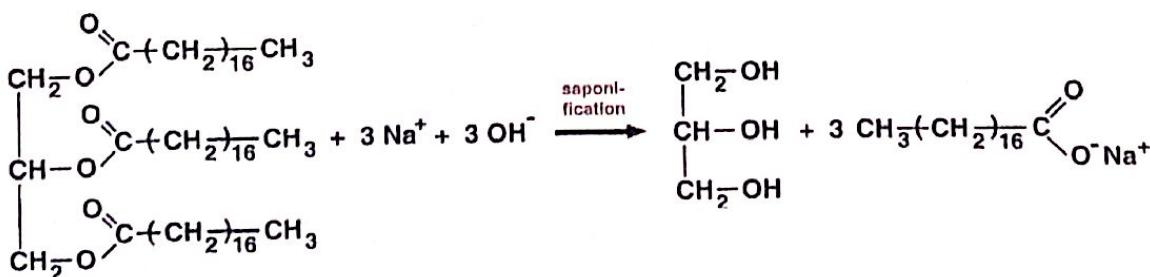

$$x_2 = 0,176 \text{ mol}$$

$$n(\text{alcool}) = 0,324 \text{ mol}$$

$$n(\text{acide}) = 0,024 \text{ mol}$$

c) pour déplacer l'équilibre vers la droite et augmenter le rendement.

2) a) remplacer l'acide palmitique par l'acide oléique : $\text{CH}_3\text{-}(\text{CH}_2)_7\text{-CH=CH-}(\text{CH}_2)_7\text{-COOH}$

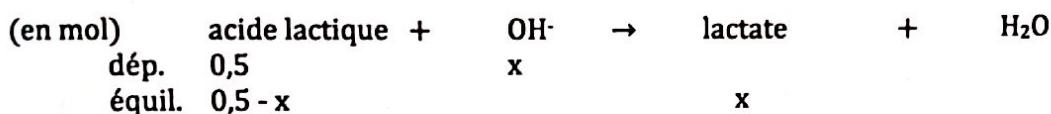

b) -anions carboxylate adsorbés à la surface de l'eau

- surface du liquide formée de chaînes carbonées, forces d'attraction faibles, tension superficielle diminue

- savons : agents mouillants (eau détendue) et propriétés émulsifiantes

IV. Mélange tampon (6p)

$$1) n(\text{acide lactique}) = c \cdot V = 0,5 \text{ mol/L} \cdot 1 \text{ L} = 0,5 \text{ mol}$$

$$pH = pK_a + \log \frac{x}{0,5 - x}$$

$$x = n(\text{lactate}) \text{ formé} = n(\text{OH}^-) \text{ ajouté} = 0,287 \text{ mol}$$

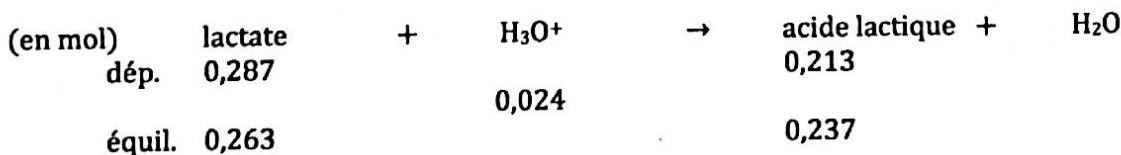

$$m(\text{NaOH}) = n \cdot M = 0,287 \text{ mol} \cdot 40 \text{ g/mol} = 11,5 \text{ g}$$

$$2) m(\text{HCl}) = 2,38 \text{ g}$$

$$m(\text{HCl}) \text{ pur} = 2,38 \text{ g} \cdot 0,37 = 0,88 \text{ g}$$

$$n(\text{HCl}) = m/M = 0,024 \text{ mol}$$

$$n(\text{acide lactique}) = 0,5 \text{ mol} - 0,28 \text{ mol} = 0,213 \text{ mol}$$

$$pH = pK_a + \log \frac{0,263}{0,237} = 3,92$$

V. Dosage d'un vinaigre. (10p)

2) Phénolphthaleine

$$3) c_0 (S) = \frac{c(\text{NaOH}) \cdot V(\text{NaOH})}{V(S)} = 0,84 \frac{\text{mol}}{\text{l}}$$

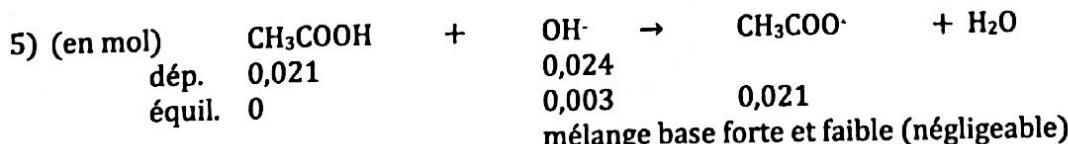

$$c(\text{vinaigre}) = 0,84 \frac{\text{mol}}{\text{l}} \cdot \frac{150}{50} = 4,2 \frac{\text{mol}}{\text{l}}$$

$$4) K_b = 5,62 \cdot 10^{-10}$$

$$c(\text{acetate au P.E.}) = \frac{0,021 \text{ mol}}{0,021 \text{ l} + 0,025 \text{ l}} = 0,465 \frac{\text{mol}}{\text{l}}$$

$$x^2 + K_b x + K_b c = 0$$

$$x = [\text{OH}^-] = 1,6 \cdot 10^{-5} \text{ mol/l} \quad \text{pOH} = 4,8 \quad \text{pH} = 9,2$$

$$pOH = -\log \frac{0,003}{0,025+0,024} = 1,2 \quad \text{pH} = 12,8$$

$$6) \alpha = \sqrt{\frac{K_a}{c_0}} = \sqrt{\frac{1,76 \cdot 10^{-5}}{0,84}} = 0,0046$$

Le degré de dissociation d'un acide augmente à dilution croissante, loi de le Chatelier
